Fractures

for clarinet and computer (2012)

Program Notes

Fractures celebrates nostalgia and the past, while recontextualizing the past into something completely new. The work appropriates ideas from acoustic works for clarinet by composers such as Gershwin, Tchaikovsky, and William O. Smith. At times, the work is a rhapsodic fantasy inspired by the many popular synthesizer albums from the 60's and 70's created in the wake of Wendy Carlos' seminal album *Switched on Bach*. These sections contain very brief sampled quotations from LPs of electronic works that explore the synthesis of clarinet-like tones. These quotations are borrowed from popular recording artists of the time, such as Wendy Carlos, Dick Hyman, Ruth White, and Mort Garson, along with many others. Samples of vintage synthesizers are also a part of this sonic palette. Mannerisms and styles from these works also influence the score for the clarinetist.

Performance Notes

Notation

Accidentals are maintained throughout each bar and are canceled by barlines.

If no meter is given there are two possible options for tempo interpretation:

1. A bracket provides the total duration of the bar or system. Bracket subsets may also be specified. Stems or flags provide relative duration.

2. Rhythms are played based upon the specified tempo without any downbeat accentuation.

= Aggressively sing or scream through the clarinet while fingering the given note. Scream within a minor third of the notated pitch to achieve an aggressive timbral effect. Sustain the scream for the given duration.

= Improvise a melodic line in a similar musical manner to the surrounding material following the general direction or contour provided.

= Glissando that follows the direction or contour of the solid line. Pitch change should match the relative location on the staff over time.

= Timbre trill

Technical Notes

The computer part for *Fractures* was written using the software Max/MSP (version 5.18). This version (or a later version) of Max/MSP or Max/MSP Runtime should be used to perform the computer part.

The piece requires one microphone to amplify and process the sound of the clarinet. Quality condenser lavalier microphones are preferable.

Fractures utilizes a variety of computer cues. There are cues for the following: Events, "Start Recording," and "Stop Gestures." Stop Gesture cues accomplish two different things: 1. they stop the recording and 2. they play back the prerecorded sample in various prescribed ways.

The technician can use a MIDI controller or ASCII keyboard to control the Start Recording and Stop Gestures used in this piece. The Max/MSP patch for *fractures* contains a patcher "setup_MIDI" where one can modify the MIDI messages that control the Start Recording cue and the various Stop Gesture cues. The patch can also set it up so a computer keyboard can be used to accomplish these cues. To turn the ASCII keyboard control on, turn on the toggle switch located above the patcher, "keyboard."

Stop Gesture Key (Stop Gestures a-h are keys 1-8 respectively)

- Stop Gesture a (1): immediately plays the prerecorded sample at normal speed.
- Stop Gesture b (2): immediately plays the prerecorded sample transposed up an octave.
- Stop Gesture c (3): immediately plays the prerecorded sample transposed down an octave.
- Stop Gesture d (4): immediately plays the prerecorded sample transposed randomly within a two-octave span.
- Stop Gesture e (5): immediately plays the prerecorded sample backwards at normal speed.
- Stop Gesture f (6): immediately plays the prerecorded sample backwards transposed up an octave.
- Stop Gesture g (7): immediately plays the prerecorded sample backwards transposed down an octave.
- Stop Gesture h (8): immediately plays the prerecorded sample backwards transposed randomly within a two-octave span.

Notation of Cues for Computer

Events:  (space bar)

Clear Buffers:  (delete)

Rehearsable Cues: 

Stop Recording:  (backslash)

Non-rehearsable Cues: 

Start Recording:  (return)

Stop Gestures:  = Stop Gesture "a"

 = Choose any Stop Gesture
